How to Use Puckboard Logging (PBL)

Capt Cale Simmons

1. If you don't have it, get mattermost or a platform1 account (see other attachment)
2. Make sure you know your username / password for mattermost, reset it if you don't know it. Don't forget it. (this will be changed soon to a digital cert)
3. If you haven't set up the google authenticator on your device you will need to do that too. (see the attached guide for mattermost set up / google auth)
4. Make sure you have the Puckboard Logging App installed on your EFB. Via HUB / app store

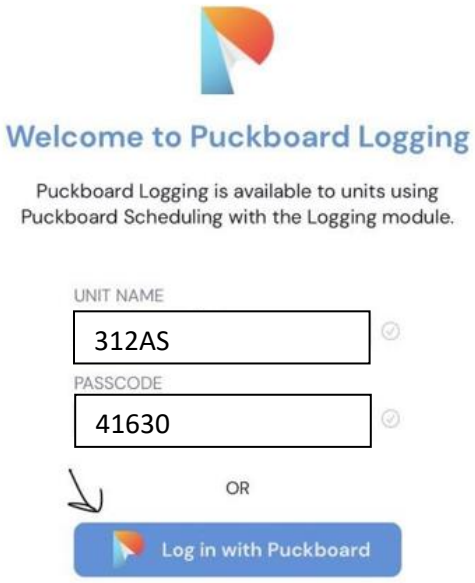

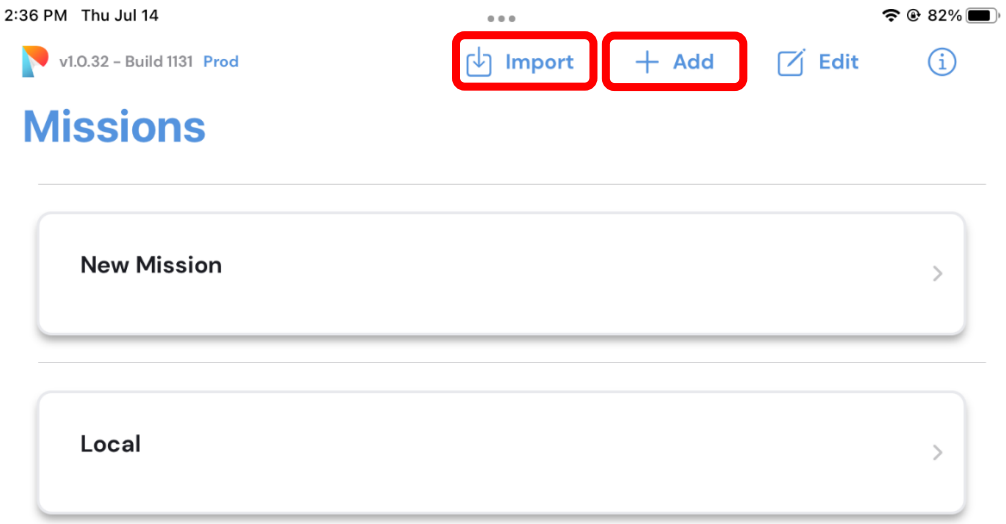

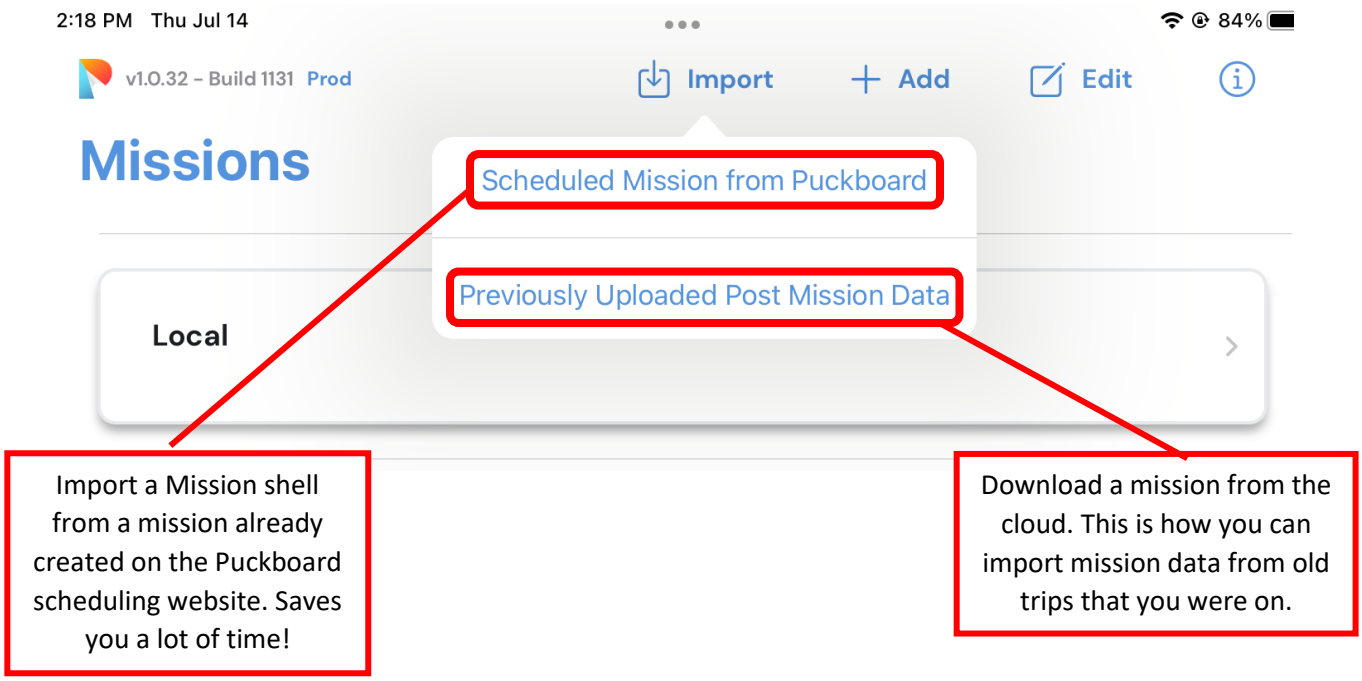

It might take a bit to download it, its not as fast as the normal app store.

5. Login using the Unit Name and Passcode, or with your Mattermost/Puckboard Username, Password, and Google Authenticator Code.

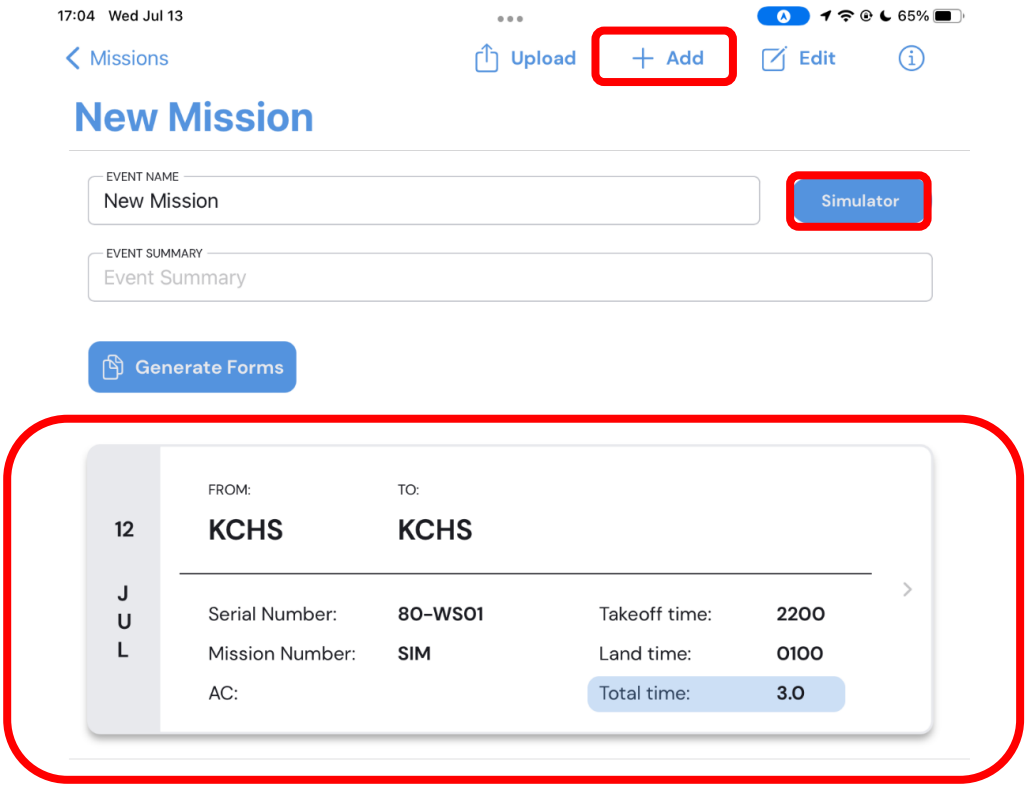

6. Once in the PBL App. Click " + Add" to create a "New Mission". Or click "Import" to download a mission from Puckboard or from the cloud. Then click on the "New Mission".

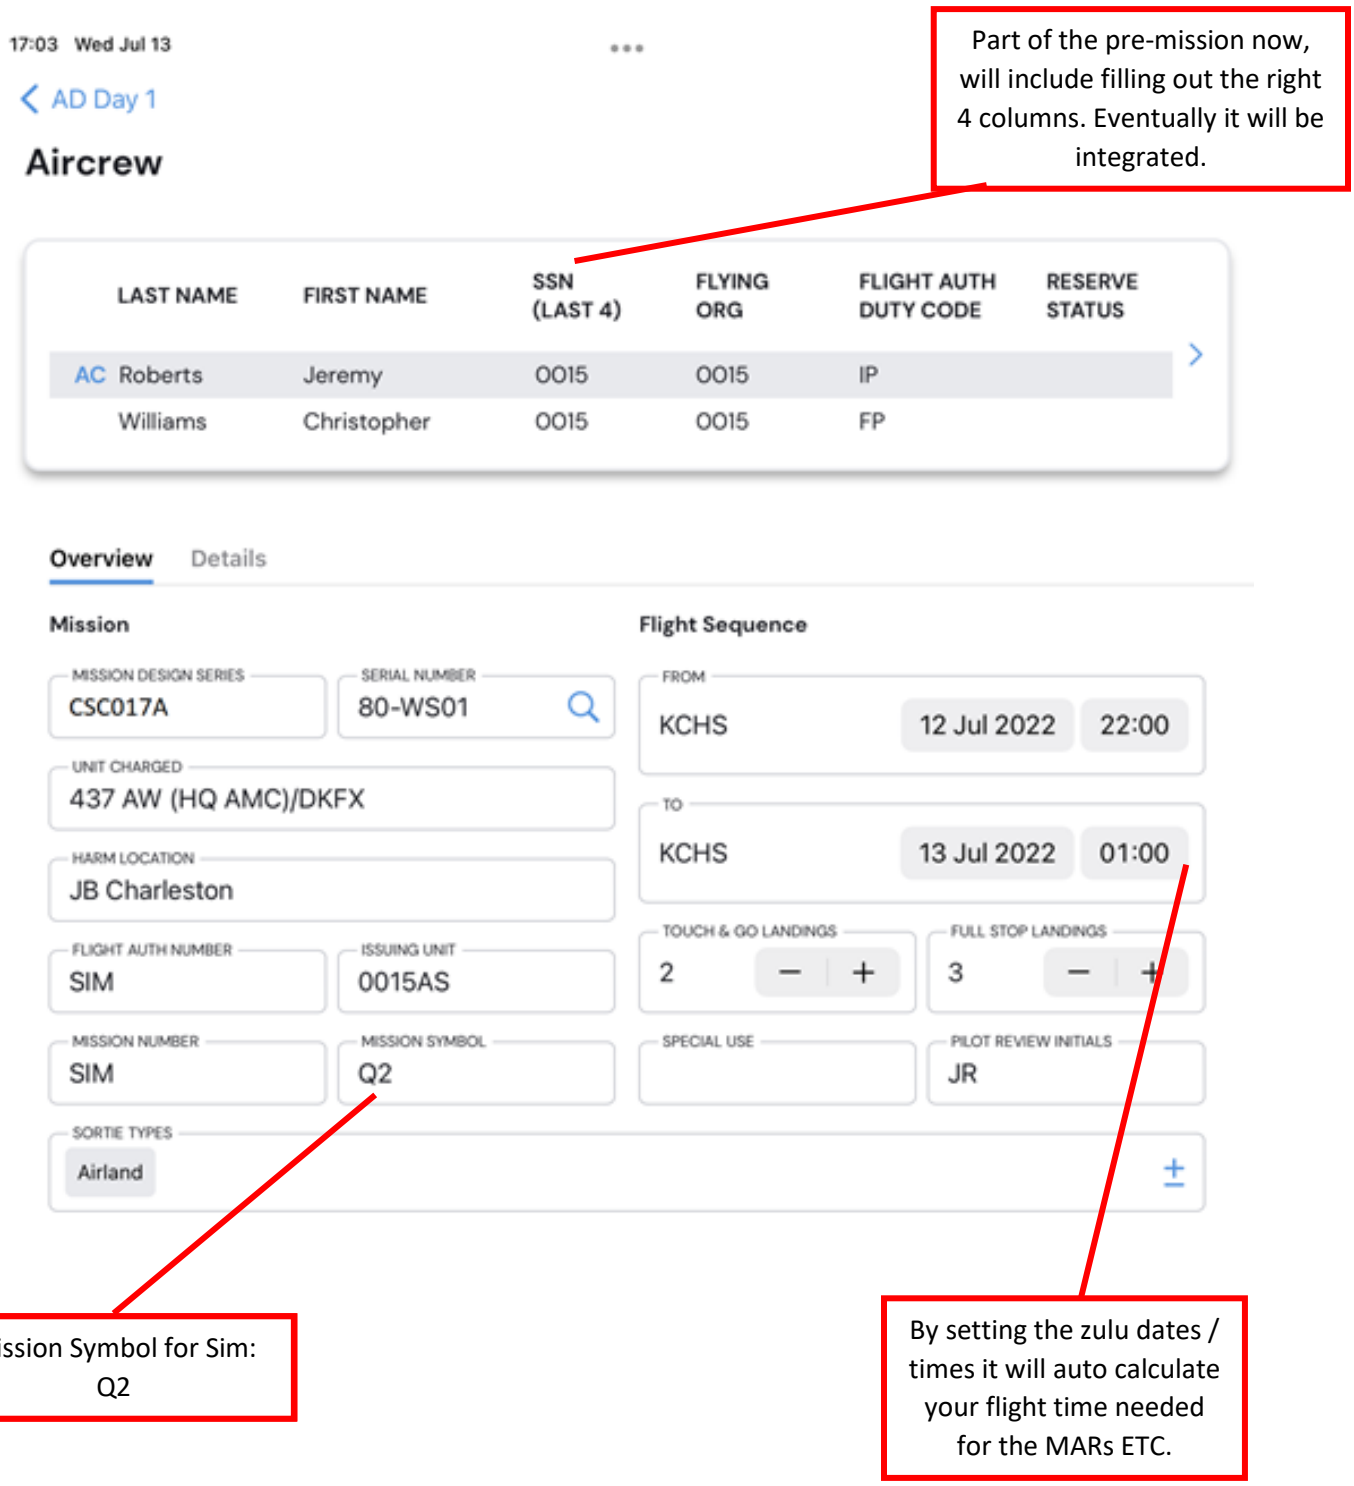

7. If you are logging a sim, tap the "Simulator" button to prepopulate "SIM" as the Mission Number. Event Name could be "AD Day 1", or "Iraq & Back" or whatever is appropriate. You can add individual flights/sorties by clicking "+ Add". Then click anywhere on the flight box.

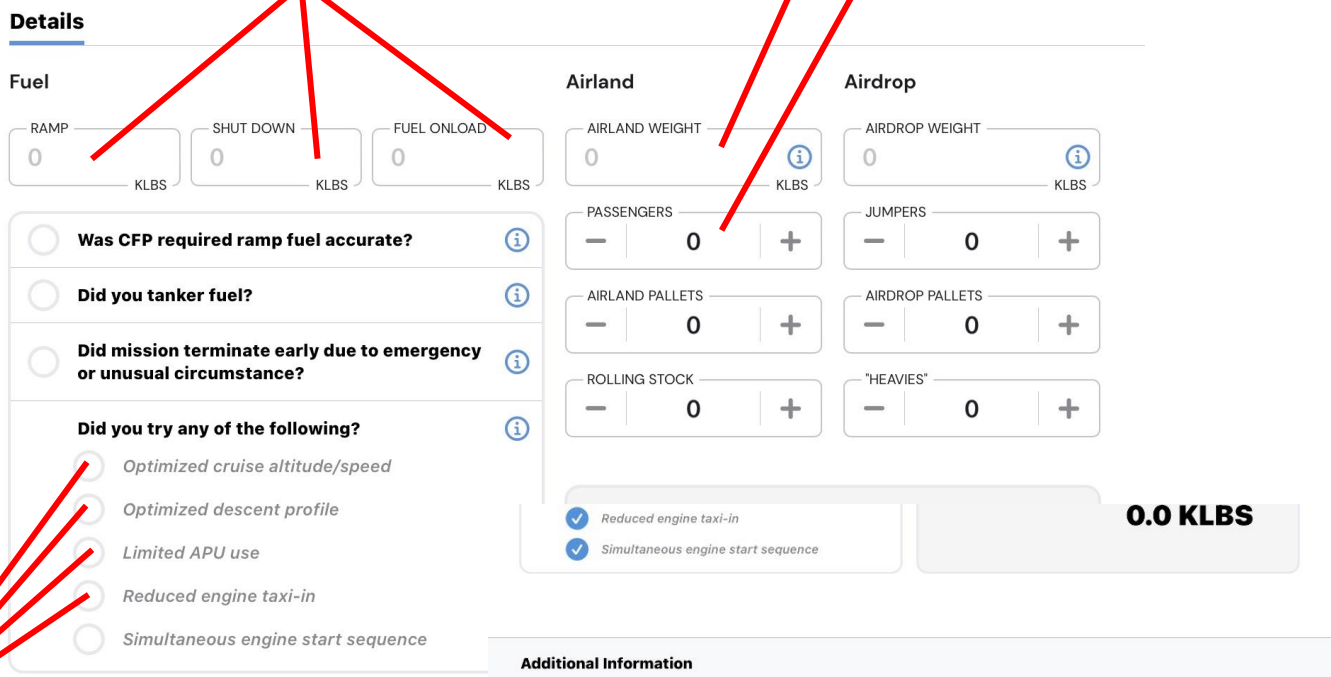

8. Enter the Aircrew (tap the star next to the AC) & Mission Overview: (Disregard the 17 info)

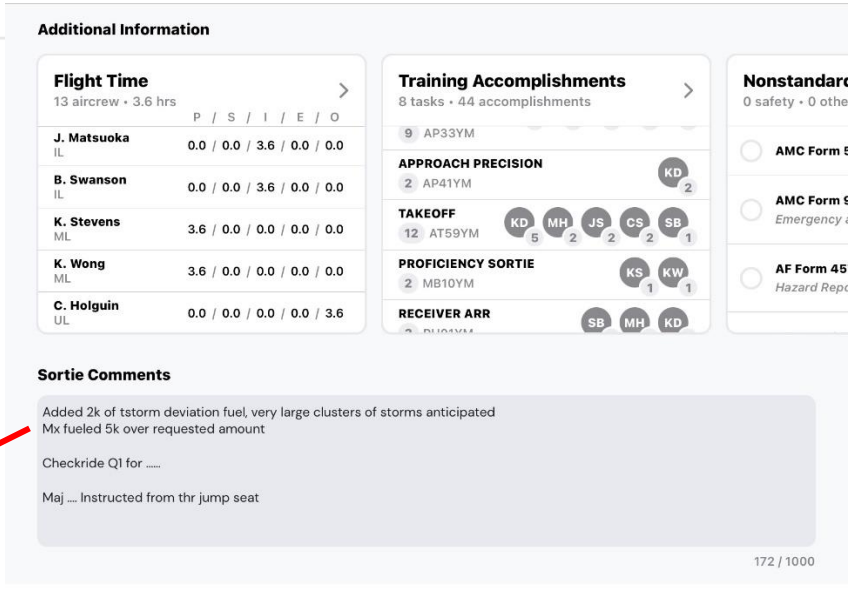

9. Fill out the Mission Details**. This page is mandatory** and is where MEEP is gathering metrics from. Check the appropriate boxes and add comments at the bottom of the page (i.e. Used precision fuel planning to reduce takeoff fuel 22K from standard ramp load).

Note: Shut Down fuel is recorded after engine shut down, not to be confused with landing fuel.

The rest of this info gets populated into the form 73, don't forget it too.

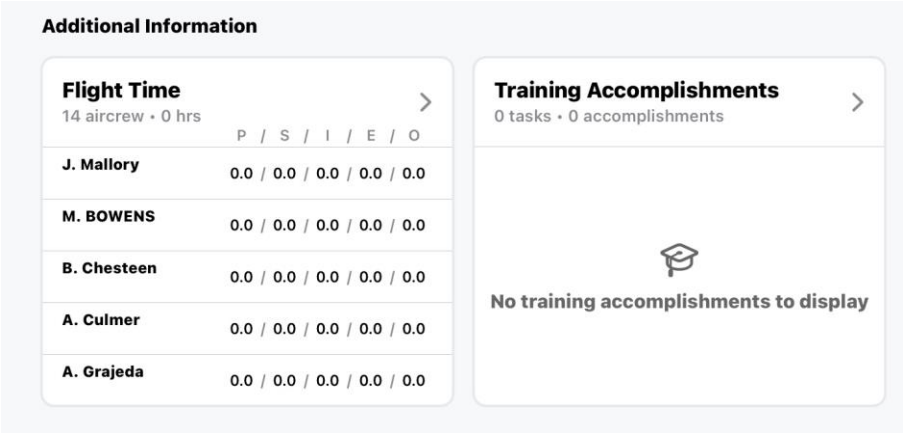

Very important for MEEP calculations! Do it if you can!

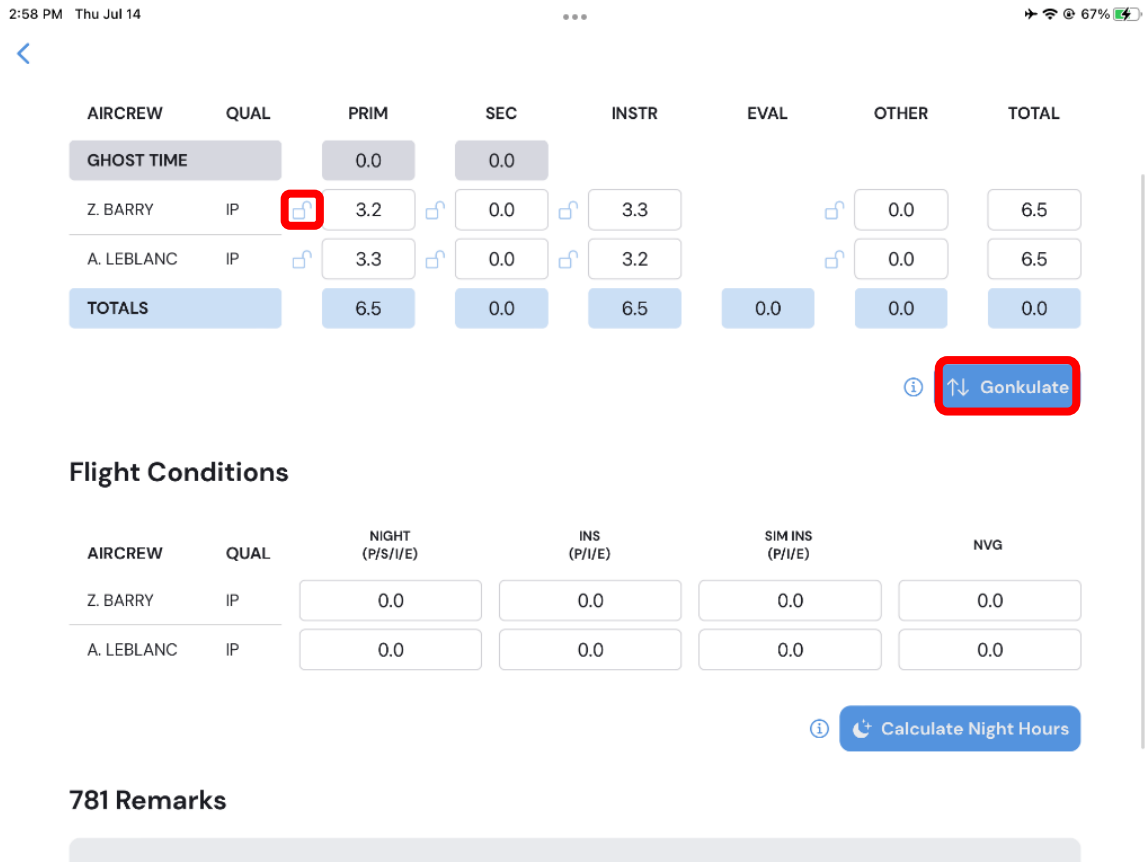

Please include comments if you took extra gas, in the sorties comments, this helps out MEEP numbers significantly.

10. To divvy up Flight Hours, click on the tab then Gonkulate. This will split it down the middle usually fair.

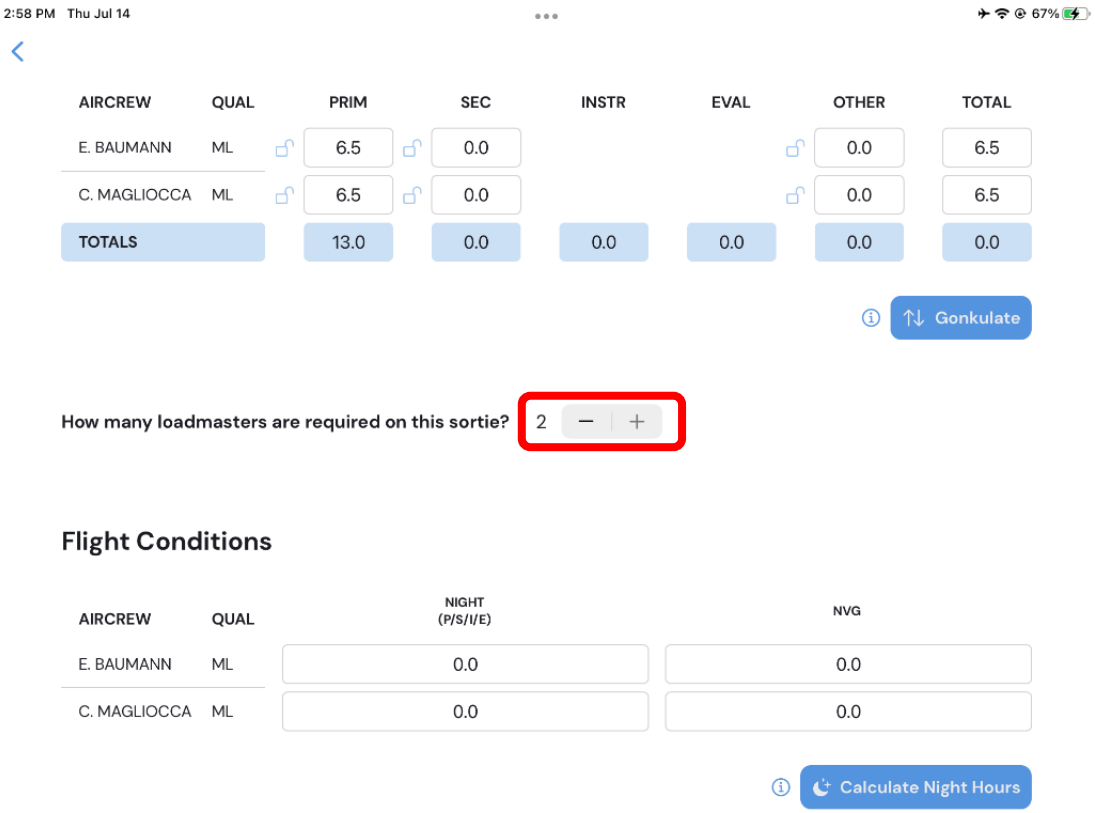

If you need to give one member more or less time, add the amount you want to give then hit the lock button next to it, then gonkulate again, it will redistribute the remaining hours appropriately. You may need to do this, for various other reasons. Calculating night hours is automatic based on your flight locations, but you will need to log the instrument time manually, especially if you are logging an approach!

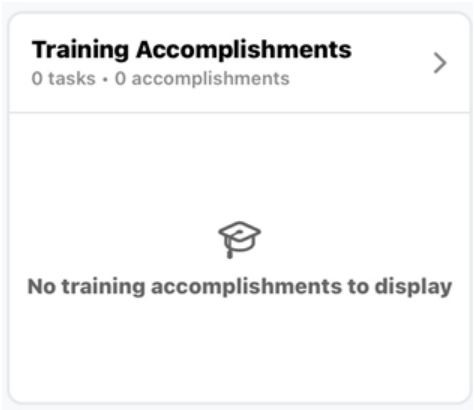

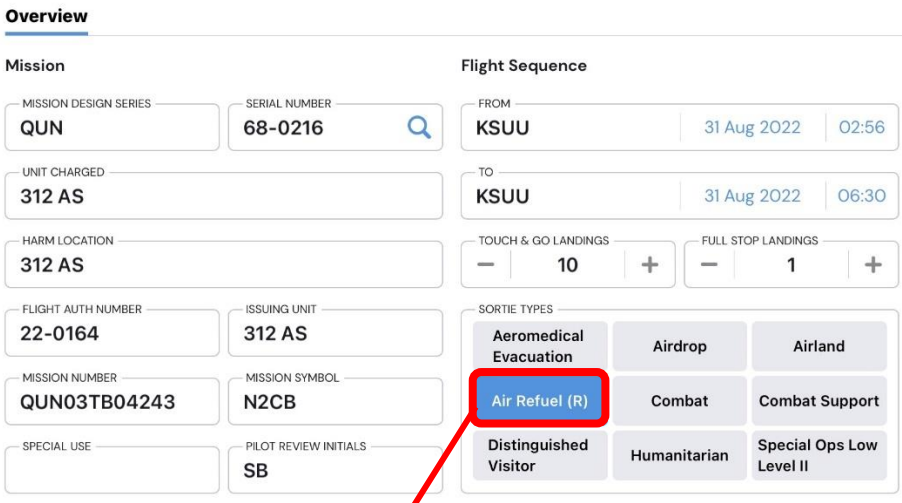

Remember: Night/instrument/NVG time must be logged in order to log night/instrument/NVG events, respectively.

If a mission requires more Loadmasters, indicate that below to ensure both LMs log accurate primary time. The time calculations are getting fixed for C-5s so you may have to manually enter / lock the times for loads and engineers.

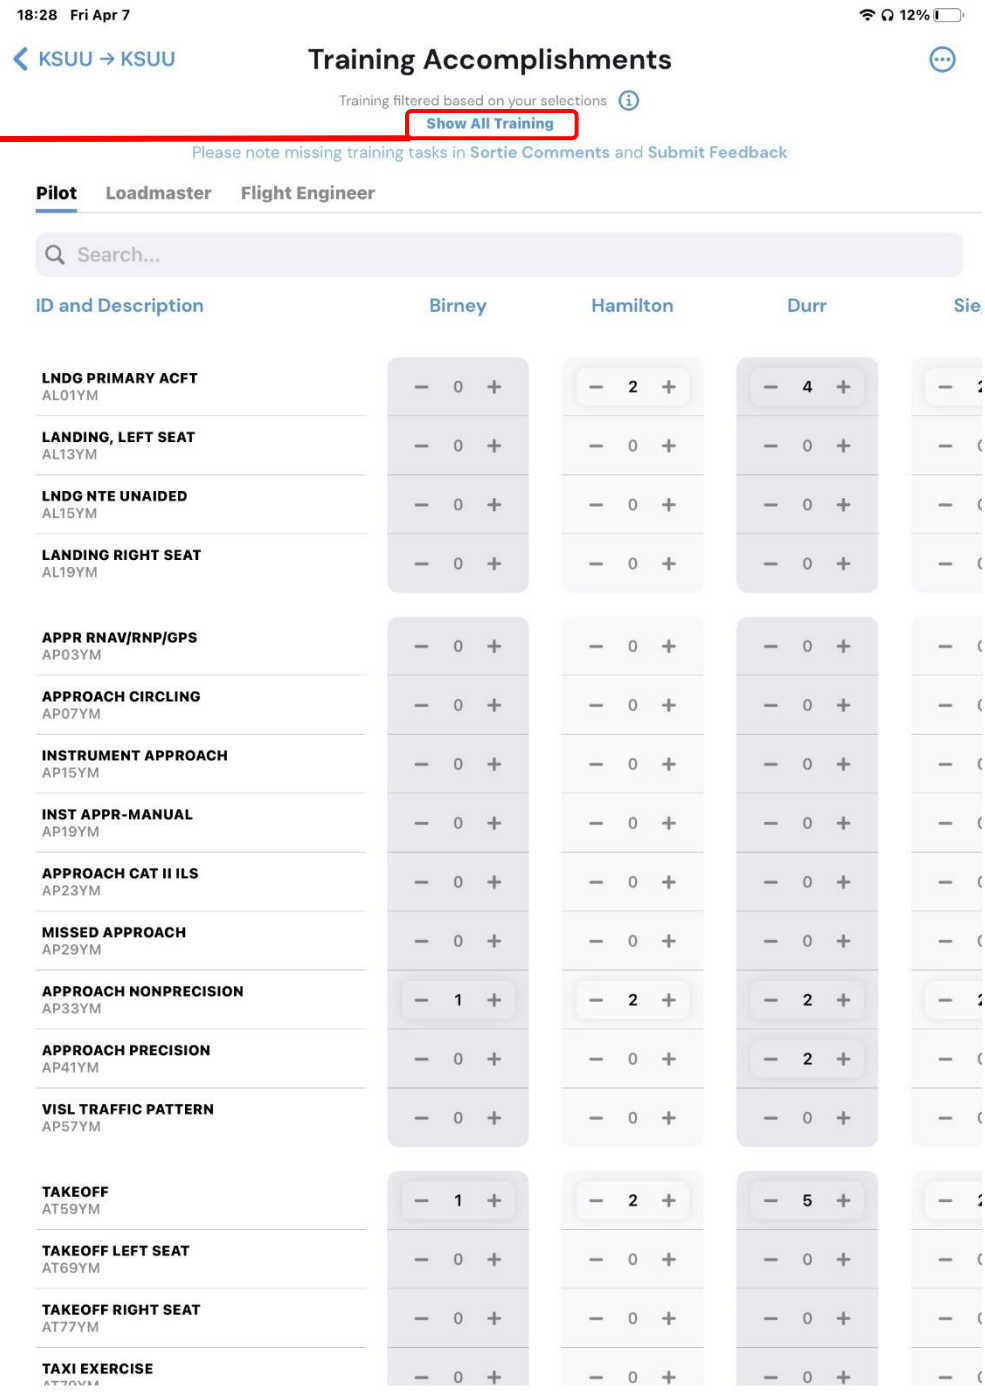

11. Next log the training items accomplished. Everything should be filtered out, to be just C-5 specific, if something is missing please let me know!

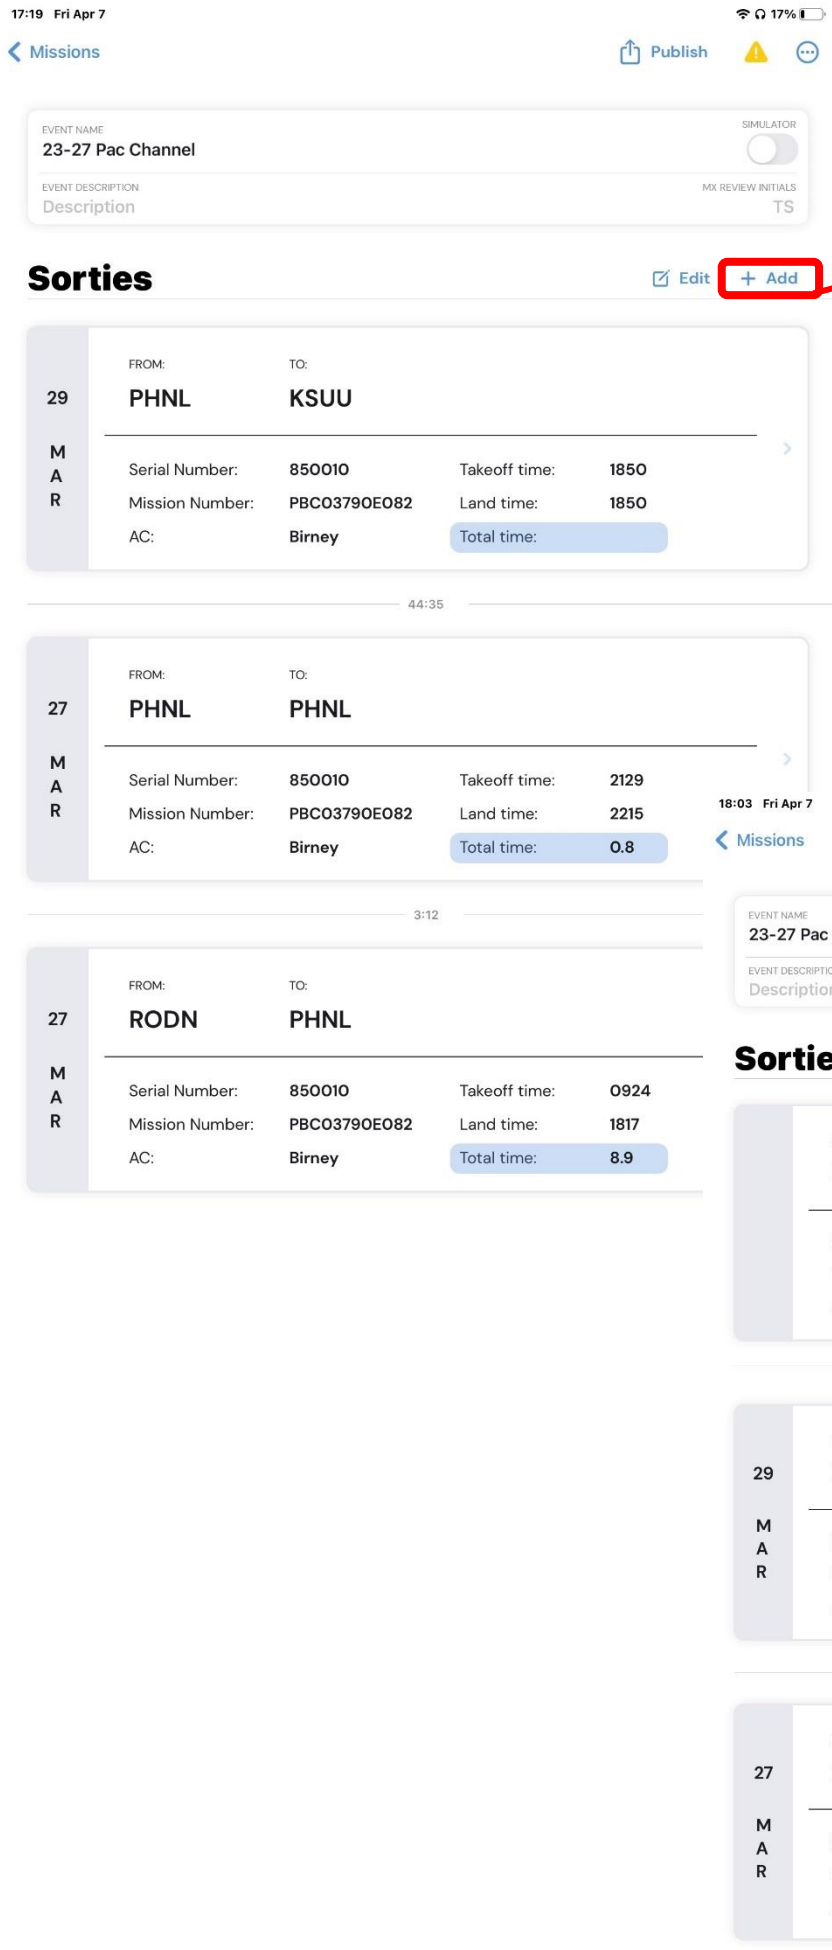

Pretty easy to do, just double check that in the overview for the sortie that you have the right number of touch and goes / full stops and select the sortie type (AR). This program will eventually filter out AR events in the training accomplishments tabs if not selected and error check the LDGs/TOs

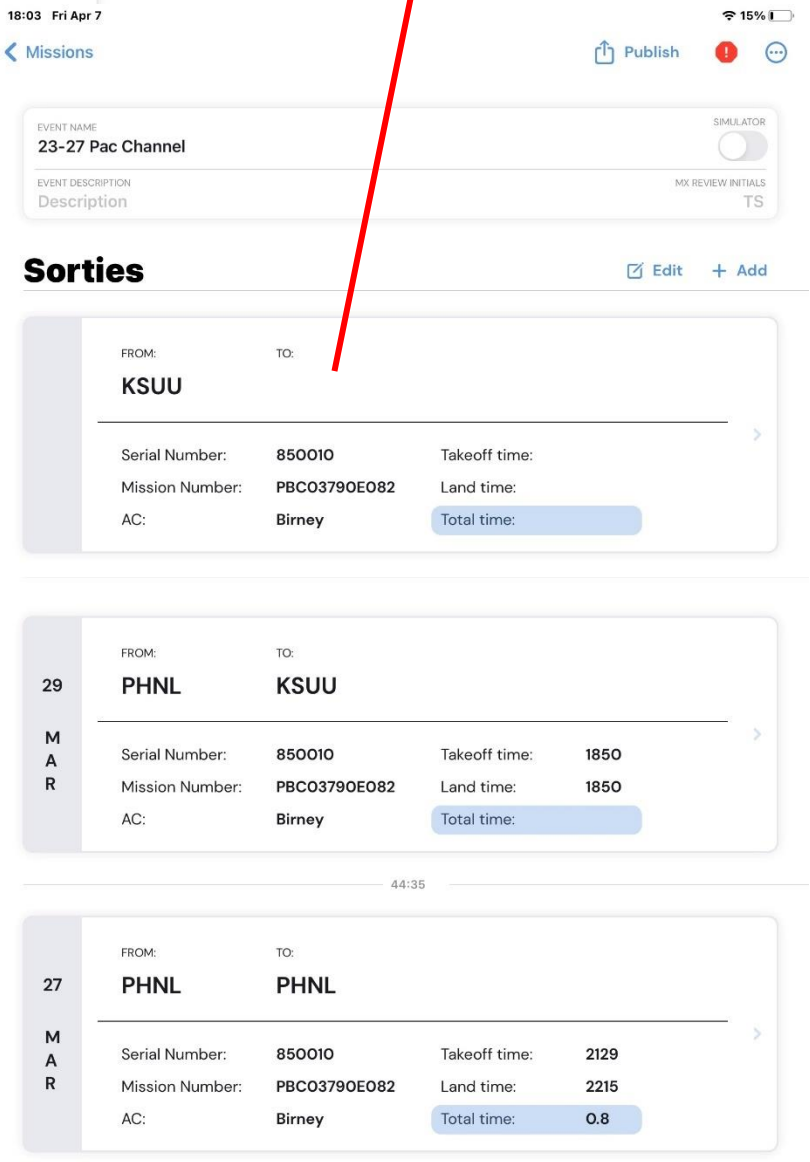

'Show All Training' will show everything

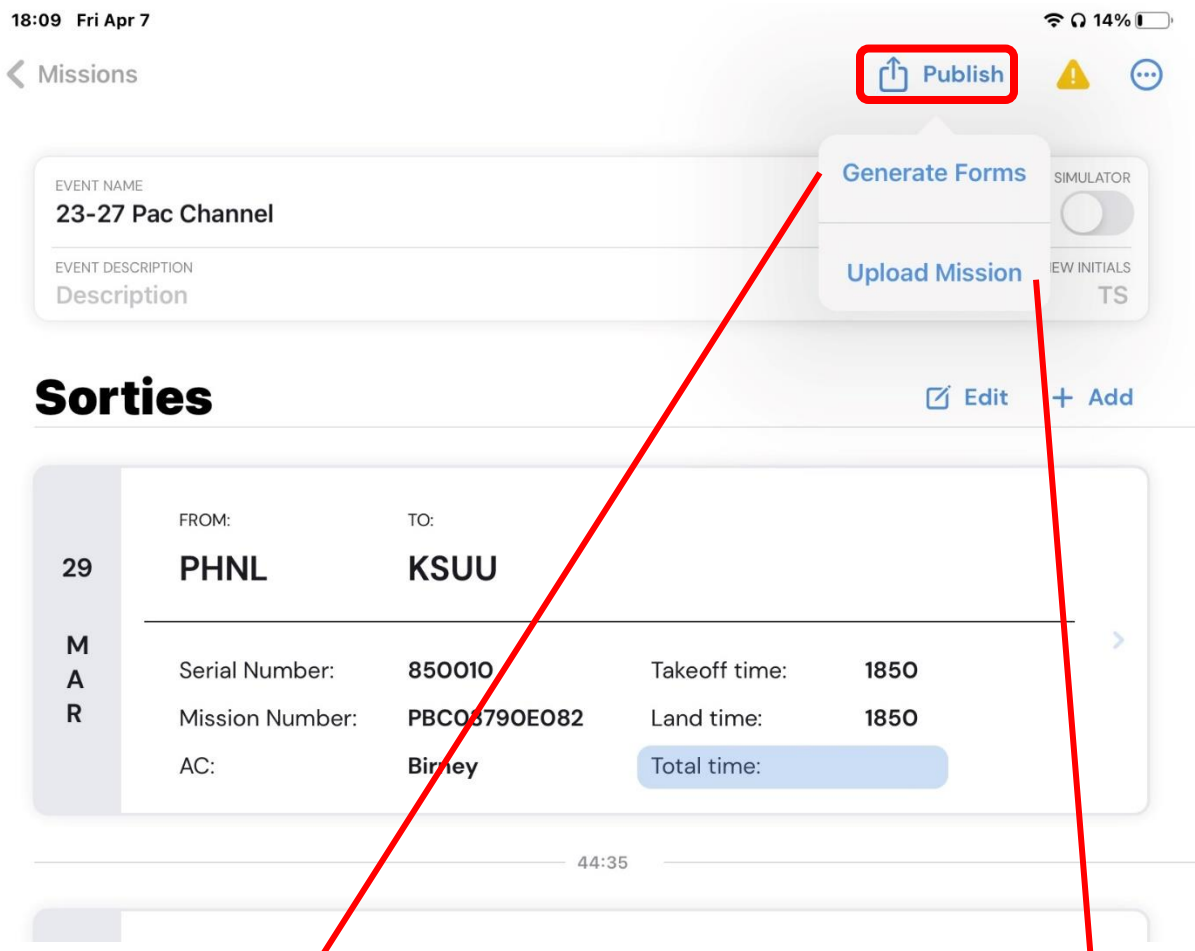

After you finish a leg, you can either submit it, (next page) or add another leg. It will add a new tab, starting in the location where you just landed and copy all the sortie info.

You will just have to fill out the new applicable info. Times, MARs, Fuel, ETC

12. To view your 781, return to the Mission Home page and click “Upload”

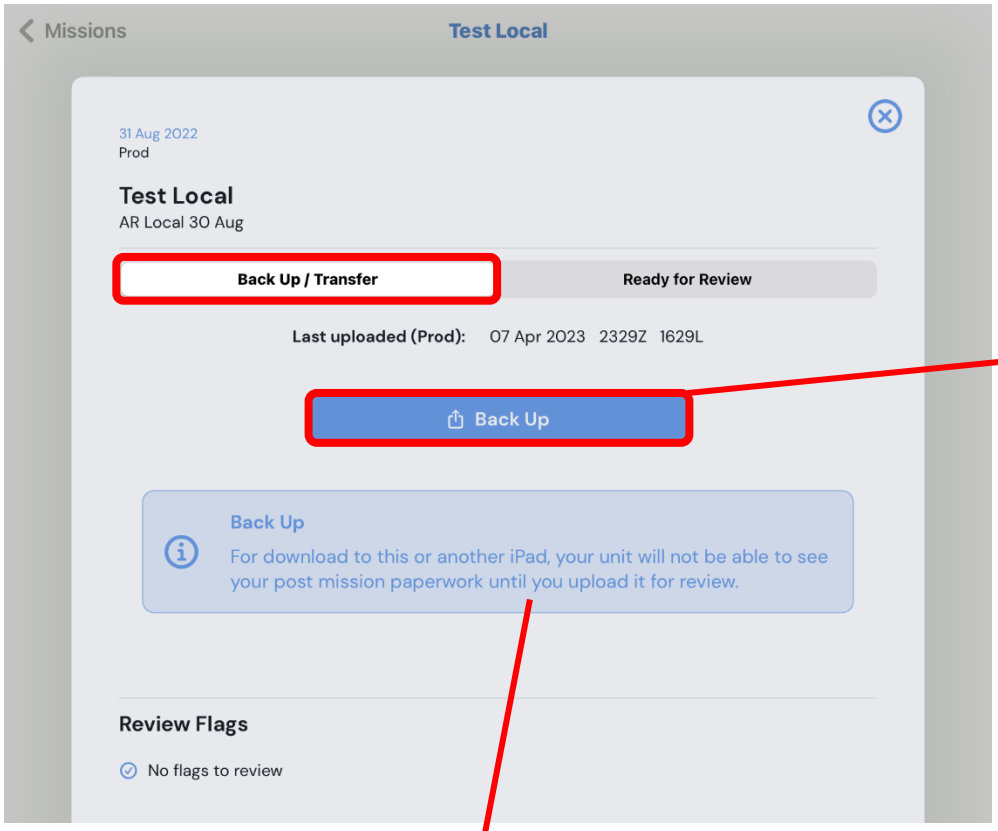

To see the current 781s, fuel data, and a summary of all logged training accomplishments or to save a digital copy, click “Generate Forms” which pops up a PDF

Once you click “Upload Mission” you have two options: (see pictures on next slide)

1. Back Up / Transfer – This saves the entire mission to the cloud to allow other members of your crew to download the mission to their PBL app.

2. Ready for Review – This sends the mission data to your unit’s ADOs and SARM for review. This must be done for the MEEP team to be able to access your fuel data. Fix any flagged errors before submitting

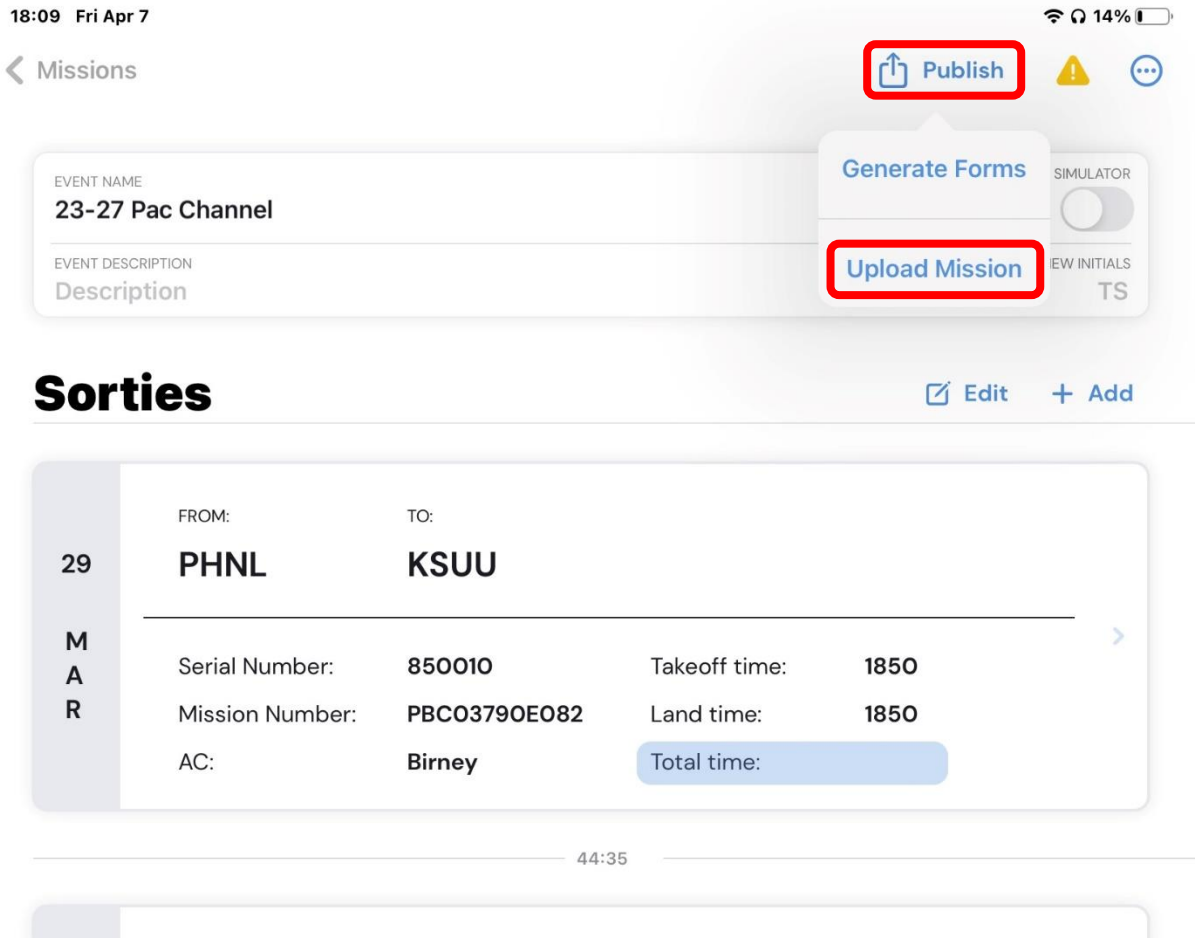

Back up to the cloud.

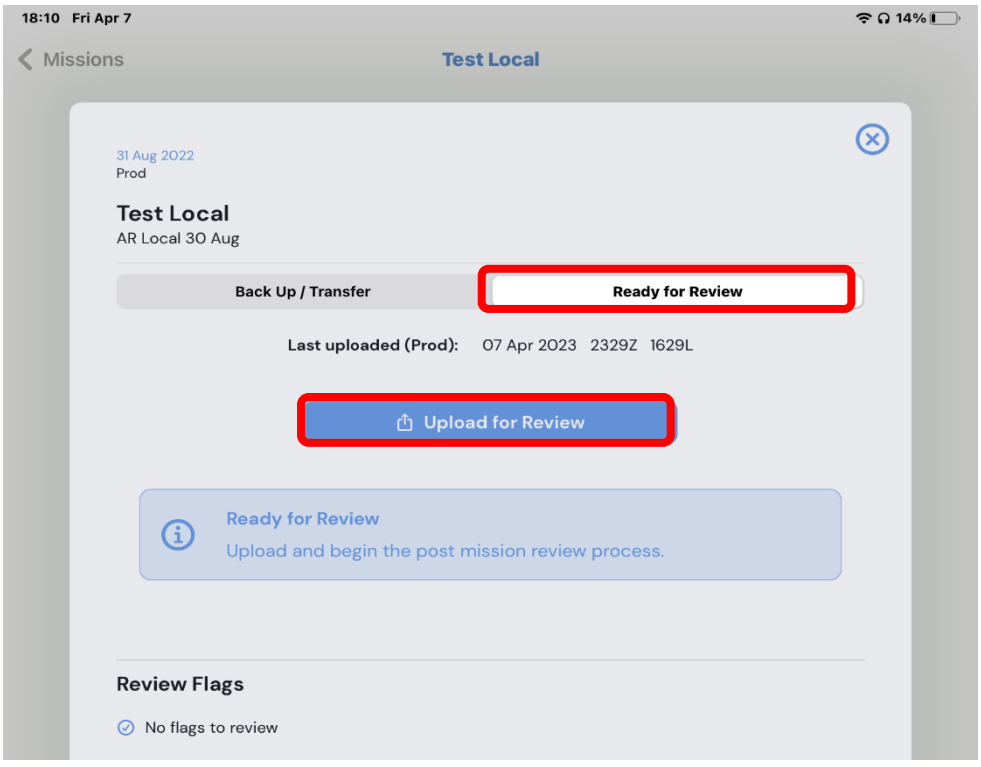

Saves your work and uploads it to the cloud.

Once backed up, as it says here, you can only download it to another ipad once its uploaded and ready for review.

11. When you are DONE with your trip, go to the main page of the trip, publish and upload mission to send it to SARM for review.

Why this matters?

Its coming, soon it will be mandatory. Here is Dovers FCIF

SUBJECT: Puckboard Logging Mandatory Use

//UNCLASSIFIED// (FCIF 22-035, Page 1 of 2)

1. This is applicable to all 437 AW aircrew. Place in FCIF Vol 1 B and retain until rescinded.

2. In order to standardize currency logging across the group, compliance with Puckboard Logging and MEEP fuel tracking are now mandatory. Puckboard Logging is an app now available on the EFB which provides a means to complete the 781 as well as aircrew currency logging. The Mission Execution Excellence Program (MEEP) is a larger program encompassing many different initiatives, which was previously implemented in FCIF 22-028. The program is a tracking system that provides trend analysis of resource stewardship. MEEP fuel tracking questions are incorporated in Puckboard Logging to make it easier on aircrew members. Amplifying information on MEEP is attached.

3. Crews are directed to input their fuel tracking information through the Puckboard Logging app. At a minimum, an aircrew member will complete and submit the 781 via Puckboard Logging, which consists of both the Overview and Details tabs. The fuel quantities, weights and fuel related questions will be completed. The Aircraft Commander will review this 781 and add comments as necessary. Taking off with excess fuel must be justified in the Sortie Comments. If unforeseen circumstances occurred that resulted in higher than normal fuel weights upon return, please explain in the comments. A hard copy 781 is still required to be completed for maintenance.

a. Crews should complete fuel planning during mission planning day and call in that required fuel no later than 1200L

It’s the only way we can track our fuel savings… we can get $$$ O&M funds for our squadron. Crazy money.
